

# Panelled System

The Panelled system uses laminated or veneer panels to build a room within a building or a structure creating a home from home bathroom. The flexibility of the system means that the exact number of cubicles, urinals and hand basins can be selected depending on the nature of the event and number of guests.

Installing temporary loos in a permanent building is a solution that is not often considered; yet it is possible and it can render otherwise unusable spaces as tenable options. For example, if loos are required in a basement for a party or on the first floor of a hotel for a conference the IGLOOS® Panelled Loo System provides the solution.

The system is not only used exclusively for hospitality areas, it is also used to create general public areas. The material chosen for the panels, the floor covering and the type of hand basin supplied very much determines the style of the room.

There are a number of options available including a choice of hand basins, wall colour, interior doors and mirrors all of which can be discussed at the time of quotation.

## Requirements for Operation

The Panelled loos need to be installed inside a building or structure.

Constant power supply is required for installation and during the event which varies according to the quantity of stock.

Constant fresh water supply with good pressure for installation and during the event. The fresh water is necessary for both the hand basins and loo pans.

Waste is either collected in vacuum tanks or the system is plumbed into the mains drainage.
